Amaza™ HT Nucleofector™ protocol for human CD34+ cells

Cell description

This protocol is designed for unstimulated human CD34+ cells; self-isolated or Poietics™ human cord blood CD34+ progenitor cells (Lonza, Cat. No. 2C-101) or Poietics™ human bone marrow blood CD34+ progenitor cells (Lonza, Cat. No. 2M-101 (frozen) or Lonza, Cat. No. 1M-101C (fresh)).

Example for Nucleofection™ of human CD34+ cells

Average transfection efficiency and viability of CD34+ cells 24 hours post Nucleofection™. 5×10^4 CD34+ cells from cord blood (2C-101, Lonza) or bone marrow (2M-101, Lonza) were transfected with program EO-100-AA and 0.4 μg of pmaxGFP™ vector. 24 hours post Nucleofection™, cells were analyzed on a FACS-Calibur™ with HTS option. Cell viability was determined as a relative portion of untreated control (measured with the ViaLight™ Plus Bioassay Kit, LT07-221, Lonza).

Storage and stability
Store Nucleofector™ solution, supplement and pmaxGFP™ vector at 4°C. For long-term storage, pmaxGFP™ vector is ideally stored at -20°C. The expiration date is printed on the solution box. Once the Nucleofector™ supplement is added to the Nucleofector™ solution, it is stable for three months at 4°C.

Note
HT Nucleofector™ solutions can only be used with conductive polymer cuvettes, i.e. in the HT Nucleofector™, the 96-well Shuttle™ device and in the 4D-Nucleofector™ system. They are not compatible with the Nucleofector™ II/2b device.
BioResearch

Amaxa™ HT Nucleofector™ protocol
for human CD34+ cells

Required material

Note
Please make sure that the entire supplement is added to the Nucleofector™ solution.

- HT Nucleofector™ system
- Supplemented HT Nucleofector™ solution at room temperature
- Supplied 384-well Nucleocuvette™ plate(s)
- Supplied pmaxGFP™ vector, stock solution 1 µg/µl

Note
Volume of substrate solution added to each sample should not exceed 10% of the total reaction volume (2 µl for 20 µl reactions). For positive control using pmaxGFP™ vector, please dilute the stock solution to reach the appropriate working concentration.

- Substrate of interest, highly purified, preferably by using endotoxin-free kits; A260 : A280 ratio should be at least 1.8
- 96-well culture plates or culture plates of your choice
- Culture medium: X-VIVO™ 15 (Lonza, Cat. No. 04-4180) supplemented with SCF [25 ng/ml], TPO [50 ng/ml] and FLT3 [50 ng/ml]
- Differentiation medium [for myeloid differentiation]: X-VIVO™ 15 (Lonza, Cat. No. 04-4180) supplemented with GM-CSF [10 ng/ml], G-CSF [10ng/ml], IL-6 [10 ng/ml], IL3 [10 ng/ml] and SCF [100 ng/ml]
- Differentiation medium [for lymphoid differentiation]: X-VIVO™ 15 (Lonza, Cat. No. 04-4180) supplemented with IL-2 [1000 U/ml], IL3 [5 ng/ml], IL7 [20 ng/ml], SCF [20 ng/ml] and FLT3 [10 ng/ml]
- Prewarm appropriate volume of culture medium to 37°C (113 µl per sample)
- Appropriate number of cells (5×10⁴ cells) per sample; lower or higher cell numbers may influence transfection results.

1. Pre Nucleofection™

Note
It is recommended to transfect cells immediately after thawing. Alternatively, cells may be expanded in culture medium (please see cell culture recommendations below). However, expansion of cells may lead to a decrease of CD34+ expression. Transfection results may be donor-dependent.

Cell culture recommendations
1.1 Replace media every 3–4 days
1.2 For passaging please spin cells down at 300×g for 10 minutes and resuspend them in fresh media. Passage cells 2 times a week
1.3 Maintain cultures between 0.1–1.5×10⁶ cells/ml
1.4 Seed out 1×10⁵ cells/ml for expansion

Note
For preparation of self isolated CD34+ cells, please follow the respective literature.

2. Nucleofection™

One Nucleofection™ sample contains
- 5×10⁴ cells
- 0.2–1 µg plasmid DNA [in 1–2 µl H₂O or TE] or 0.4 µg pmaxGFP™ vector or 30–300 nM siRNA [0.6–6 pmol/sample]
- 20 µl P3 primary cell HT Nucleofector™ solution

2.1 Please make sure that the entire supplement is added to the Nucleofector™ solution
2.2 Start HT Nucleofector™ software, verify device connection and upload experimental parameter file (for details please refer to the HT Nucleofector™ manuals)
2.3 Select the appropriate HT Nucleofector™ program EO-100-AA
2.4 Prepare cell culture plates by filling appropriate number of wells with desired volume of recommended culture medium, e.g. 73 µl* (see note at the end of this chapter) for one well of a 96-well plate and preincubate/equilibrate plates in a humidified 37°C/5% CO₂, incubator
2.5 Pre-warm and equilibrate an aliquot of culture medium to 37°C (40 µl per sample) in a cell culture plate or flask
2.6 Prepare 0.2–1 µg plasmid DNA or 0.4 µg pmaxGFP™ vector or 30–300 nM siRNA [0.6–6 pmol/sample]
2.7 Count an aliquot of the cells and determine cell density
2.8 Centrifuge the required number of cells (5×10⁴ cells per sample) at 300×g for 10 minutes at room temperature. Remove supernatant completely
2.9 Resuspend the cell pellet carefully in 20 µl room temperature HT Nucleofector™ solution per sample
A: One or several substrates (DNAs or RNAs) in multiples
   - Prepare mastermixes by dividing cell suspension according to number of substrates
   - Add required amount of substrates to each aliquot (max. 2 µl per sample)
   - Transfer 20 µl of mastermixes into the wells of the 384-well Nucleocuvette™ plates

B: Multiple substrates (e.g. library transfection)
   - Pipette 20 µl of cell suspension into each well of a sterile U-bottom 384-well microtiter plate
   - Add 2 µl substrates (maximum) to each well
   - Transfer 20 µl of cells with substrates into the wells of the 384-well Nucleocuvette™ plates

Note
It is advisable to pre-dispense each cell suspension into a sterile round-bottom 384-well plate or to pipet from a pipetting reservoir for multi-channel pipettes. Use a liquid handling system or at least a multi-channel pipette with suitable pipette tips. As leaving cells in HT Nucleofector™ solution for extended periods of time may lead to reduced transfection efficiency and viability it is important to work as quickly as possible. Avoid air bubbles while pipetting.

2.10 Briefly shake the 384-well Nucleocuvette™ plate with an appropriate microtiter plate shaker to make sure the sample covers the bottom and the sides of the wells without air bubbles. Alternatively thoroughly tap the 384-well Nucleocuvette™ plate

2.11 Place 384-well Nucleocuvette™ plate with closed lid onto the carousel of the plate handler of the HT Nucleofector™. Well “A1” must be in upper left position

2.12 Start Nucleofection™ process clicking “Start” in the HT Nucleofector™ software (for details please refer to the HT Nucleofector™ manuals)

2.13 After run completion, carefully remove the 384-well Nucleocuvette™ plate from the carousel

2.14 Resuspend cells with desired volume of pre-warmed culture medium (maximum cuvette volume 60 µl). Mix cells by gently pipetting up and down two to three times. Recommendation for 96-well plates: Resuspend cells in 40 µl of pre-warmed media*

2.15 Plate desired amount of cells in culture system of your choice. Recommendation for 96-well plates: Transfer 27 µl of resuspended cells to 73 µl pre-warmed media

*Note
The indicated cell numbers and volumes have been found to produce optimal Nucleofection™ results in most cases. However, depending on your specific needs you may wish to test an extended range of cell numbers. Cell numbers and volumes can be adapted such that fewer cells are transferred or duplicate plates can be seeded.
